

**“EQUIPPED TO MEET YOUR NEEDS”**

## Natural Ventilation

The function of a dairy barn is to provide sun protection in the summer, wind and moisture protection in the winter.

Modern, naturally ventilated dairy barns should be thought of as shelters.

Shelters provide relief from the elements, but not total environmental control. Inherently, they are constantly ventilated by the nature of their design.

**“EQUIPPED TO MEET YOUR NEEDS”**

Adjustable curtains are used on sidewalls and end walls to maximize ventilation openings.

Sidewall curtains are usually split in half to form a top curtain and a bottom curtain.

In most systems, top curtains drop down to open, and bottom curtains rise up to open.

Curtains that roll to open and close are preferred over those that bundle as they take up much less space when opened, and also they do not provide as much of a habitat for rodents.

Our chimneys offer energy saving ventilation and provide consistency and precise control.

Natural Flow Chimneys can be used throughout a wide variety of building designs, geographical locations and installation methods.
